

Kittys Poker Club – Full Project Requirements

1. Project Vision

The objective is to develop a scalable, secure, and real-time poker platform available on both web and mobile. The system will support private and public gameplay from day one, allowing seamless transition from controlled environments to public access. The platform must provide a smooth user experience similar to leading poker platforms while maintaining simplicity and performance.

2. Supported Game Modes

The system will include Texas Hold'em and 4-card PLO. Both must support real-time multiplayer gameplay with synchronized actions. Tables should support configurable blinds, buy-ins, and player limits. Gameplay must include all standard poker mechanics, animations, and states.

3. Table Types

Private Tables: Invite-only access, controlled by the host. Public Tables: Open for all users. Users must be able to easily switch between table types and view active tables in the lobby.

4. Tournament System

The platform must support tournament creation with configurable rules such as buy-ins, player limits, blind progression, and prize distribution. Players should be able to register, track tournament progress, and view leaderboards.

5. User System & Authentication

Users must register via email with verification. The system should include secure login, session handling, and profile management. User dashboards must display balance, history, and activity logs.

6. Payment & Credit System

The platform will operate on a credit-based system (e.g., \$1 = 1 credit). Users must be able to deposit funds using integrated payment systems (PayPal and others). The system must securely handle transactions, balances, and withdrawal logic where applicable.

7. Admin & Super Admin System

Admin Panel: Manage users, balances, games, and tournaments. Super Admin: Full control including ability to monitor live tables, view all player cards in real time, and access system-level controls. Super admin accounts must not be able to participate in gameplay.

8. UI/UX & Branding

The interface should be modern, minimal, and inspired by simple poker platforms. Full branding for 'Kittys Poker Club' must be integrated including logo, table design, and consistent visual identity across all screens.

9. Real-Time System Architecture

The platform must use real-time communication (e.g., WebSockets) to ensure instant gameplay interactions. Game state synchronization must be reliable and optimized to handle multiple concurrent tables.

10. Security Requirements

All user data and transactions must be secured using encryption. The system must prevent cheating, enforce fair gameplay, and include server-side validation for all actions.

11. Scalability

The system must be built to scale from private use to public deployment. Architecture should support increasing numbers of concurrent users without performance degradation.

12. Deployment

The final system must be deployed on client-provided hosting. Deployment includes full setup, configuration, and testing to ensure a stable live environment.

13. Testing & Quality Assurance

The platform must undergo full testing including gameplay logic, payments, user flows, and admin functionality. All bugs must be resolved before final delivery.

14. Post-Launch Considerations

The system should be designed to allow future updates, feature additions, and scaling improvements without major restructuring.
